

Dear Doctor,

Stem cell regenerative therapy, first used in equine medicine for tendons, ligaments and osteoarthritis, is now a common treatment modality for dogs and cats as well. As the leading veterinary regenerative medicine company, Vet-Stem, would like to ensure that this treatment modality is utilized with diligence and integrity.

Your client has investigated stem cell therapy as a potential option for their pet. While our goal is to help you improve the quality of life for your patients, we want to ensure that we set proper expectations. Vet-Stem is a regenerative medicine company that isolates autologous stem cells from your patient's own fat sample. The cells are returned, via FedEx overnight, for you to inject back into the patient. Our current clinical uses are osteoarthritis, soft tissue orthopedic injuries, and fracture repair.

While the process is relatively simple, we want to provide you with a basic understanding of stem cells and their various applications. To get you started we offer a free, RACE approved, 3 CE credit, online course at www.vet-stem.com/courses_register.php. We understand that you may not be familiar with our technology, so please feel free to review materials, including our peer reviewed publications, on our website. If you have any questions, one of our small animal technical veterinarians can be reached by calling (858) 748-2004, or emailing info@vet-stem.com.

Sincerely,

Robert Harman, DVM, MPVM
CEO and Founder
