

# ***VetStem Cell Therapy*** ***Canine KCS “Dry Eye”***

Canine Keratoconjunctivitis Sicca (KCS) is a disease of the eye found in an estimated 35% of dogs. Often referred to as “Dry Eye,” symptoms include decreased tear production, discomfort, and potential vision problems. Studies suggest KCS may be caused by an inflammatory process that leads to the destruction of the tear production glands. Most dogs will require lifelong treatment with medications to relieve the symptoms of KCS.

## ***VetStem Regenerative Cell Therapy***

**may be a treatment option for your dog with KCS**

Two recent studies found that symptoms of KCS in canines were reduced or completely resolved after treatment with adipose-derived stem cells.

In an effort to collect more data, VetStem is conducting a clinical research program to study the effects of VetStem Cell Therapy on dogs with KCS. Could your dog benefit from stem cells?

**Speak to your veterinarian to determine if your dog is eligible!**
